

1 Release Notes for BIND Version 9.10.4-P5

1.1 Introduction

This document summarizes changes since BIND 9.10.4:

BIND 9.10.4-P5 addresses the security issues described in CVE-2016-9131, CVE-2016-9147, CVE-2016-9444 and CVE-2016-9778.

BIND 9.10.4-P4 addresses the security issue described in CVE-2016-8864.

BIND 9.10.4-P3 addresses the security issue described in CVE-2016-2776 and addresses an interoperability issue with ECS clients.

BIND 9.10.4-P2 addresses the security issue described in CVE-2016-2775.

BIND 9.10.4-P1 addresses Windows installation issues, the %z modifier is not supported under Windows and a race condition in the rbt/rbtdb implementation resulting in named exiting due to assertion failures being detected.

1.2 Download

The latest versions of BIND 9 software can always be found at <http://www.isc.org/downloads/>. There you will find additional information about each release, source code, and pre-compiled versions for Microsoft Windows operating systems.

1.3 Security Fixes

- If a server is configured with a response policy zone (RPZ) that rewrites an answer with local data, and is also configured for DNS64 address mapping, a NULL pointer can be read triggering a server crash. This flaw is disclosed in CVE-2017-3135. [RT #44434]
- **named** could mishandle authority sections with missing RRSIGs, triggering an assertion failure. This flaw is disclosed in CVE-2016-9444. [RT #43632]
- **named** mishandled some responses where covering RRSIG records were returned without the requested data, resulting in an assertion failure. This flaw is disclosed in CVE-2016-9147. [RT #43548]
- **named** incorrectly tried to cache TKEY records which could trigger an assertion failure when there was a class mismatch. This flaw is disclosed in CVE-2016-9131. [RT #43522]
- It was possible to trigger assertions when processing responses containing answers of type DNAME. This flaw is disclosed in CVE-2016-8864. [RT #43465]
- It was possible to trigger a assertion when rendering a message using a specially crafted request. This flaw is disclosed in CVE-2016-2776. [RT #43139]
- Calling `getrrsetbyname()` with a non absolute name could trigger an infinite recursion bug in **lwresd** or **named** with **lwres** configured if, when combined with a search list entry from `resolv.conf`, the resulting name is too long. This flaw is disclosed in CVE-2016-2775. [RT #42694]

1.4 New Features

- None.

1.5 Feature Changes

- None.

1.6 Porting Changes

- None.

1.7 Bug Fixes

- A synthesized CNAME record appearing in a response before the associated DNAME could be cached, when it should not have been. This was a regression introduced while addressing CVE-2016-8864. [RT #44318]
- Fixed a crash when calling **rndc stats** on some Windows builds: some Visual Studio compilers generate code that crashes when the "%Z" printf() format specifier is used. [RT #42380]
- ECS clients with the option set to 0.0.0.0/0/0 or ::/0/0 were incorrectly getting a FORMERR response.
- Windows installs were failing due to triggering UAC without the installation binary being signed.
- A race condition in rbt/rbtdb was leading to INSISTs being triggered.

1.8 End of Life

The end of life for BIND 9.10 is yet to be determined but will not be before BIND 9.12.0 has been released for 6 months. <https://www.isc.org/downloads/software-support-policy/>

1.9 Thank You

Thank you to everyone who assisted us in making this release possible. If you would like to contribute to ISC to assist us in continuing to make quality open source software, please visit our donations page at <http://www.isc.org/donate/>.
